

Cybersecurity Incident Report: Network Traffic Analysis

Analyst	Hesham Ragab	Incident ID	INC-20260925-01
Date	September 25, 2026	Status	Post-Incident Review

1. Executive Summary

Looking at the tcpdump logs from when I tried to connect to www.yummyrecipesforme.com, it's clear that the traffic is not reaching port 53 (DNS). The ICMP "udp port 53 unreachable" messages confirm this. So it appears that the domain name hasn't been resolved for the site, which is why the page is currently down.

2. Incident Details & Discovery

Our troubles with loading the website in question began around 1:24 p.m. when users were unable to load the website. They reported seeing a "destination port unreachable" error message when attempting to view the page in question.

3. Technical Analysis

To understand the problem better, I captured all packets that went in and out of the affected server using tcpdump while trying to access the broken website from that server. All UDP traffic that was sent from this server to port 53 (on the host server) got answered with ICMP messages saying the port was unreachable.

4. Root Cause & Next Steps

The most likely cause of this issue is the DNS service on the host server not functioning correctly. The browser is unable to obtain the IP address for the website, which results in the user not being able to access the site. To begin to troubleshoot this issue, connect to the host server to see if the DNS service is running, and verify that the firewall isn't blocking UDP port 53.
